Kali Linux Basic Commands

1. Date Command

In Kali Linux, the 'date' command is used to display the **system date** and **time.** In order to display the date, we have to use the following command:

Syntax:

1. # date

```
<mark>(kali⊕ kali</mark>)-[~]
$ date
Fri Jan 27 09:06:24 AM EST 2023
```

2. Cal Command

The cal command displays the current **month's formatted calendar** on our terminal screen. If we require a more advanced version of **cal**, we can install the **ncal package** on our Linux machine, which displays the calendar vertically and provides additional options.

Syntax

1. # Cal

3. Cd Command

The 'cd' command is also called **chdir** (Change Directory). We used this command to **change** or **switch** the current working directory.

4. cp Command

In Kali Linux, the 'cp' command is used to copy files or a group of files or directories that create an exact image of a file on a disk with a different file name.

```
(kali@ kali)-[~]
$ cd Desktop

(kali@ kali)-[~/Desktop]
$ ls

Files firebox keyboard.png key.png

(kali@ kali)-[~/Desktop]
$ cp key.png files
```

5. whoami Command

The 'whoami' command is used to print the effective user ID whereas the who command prints information regarding users who are presently logged in.

The "w" command can also be used to view who is logged on and what they are doing.

6. Ls Command

One of the most useful commands in Kali Linux is the 'ls' command. The ls command lists the directory contents of files and directories. With the help of the ls command, we can easily list out every hidden file of a directory with the -a attribute, and for more detailed output, we can use the -l attribute.

Syntax

1. # ls -al

```
total 9416
 drwx- 17 kali kali
                                              4096 Jan 27 09:09

10877 Dec 5 08:43 .zshrc
```

7. Cat Command

The 'cat' (concatenate) command is one of Kali Linux's most commonly used commands, permitting us to create single or many files, concatenate files and redirect, view contain of file output in terminal or files.

Usually, we use the cat command to display the content of a file.

1. # cat filename

```
(kali® kali)-[~]
$ echo "Welcome to JavaTpoint" > file.text

(kali® kali)-[~]
$ cat file.text
Welcome to JavaTpoint
```

8. mkdir Command

The 'mkdir' command is used to create directories. For example, if we wish to create a directory named 'Penetration testing' under the 'Documents' directory, then we have to open a terminal and enter the below command:

- 1. cd Documents
- 2. mkdir Penetration testing

```
(kali% kali)-[~]

$ cd Desktop

(kali% kali)-[~/Desktop]

$ mkdir Penetration testing

(kali% kali)-[~/Desktop]

$ ls

Penetration testing
```

9. rm Command

In Kali Linux, the 'rm' command is used to **delete files.** It can be used to delete directories when we use them recursively.

```
(kali® kali)-[~]
$ cd Desktop

(kali® kali)-[~/Desktop]
$ cd Files

(kali® kali)-[~/Desktop/Files]
$ ls
image1.png java.png pics.png picture.png pp.png screen.png

(kali® kali)-[~/Desktop/Files]
$ rm pics.png

(kali® kali)-[~/Desktop/Files]
$ ls
image1.png java.png picture.png pp.png screen.png
```

10. my Command

With the help of the 'mv' command, we can move or renames files and directories on our file system.

11. uname Command

The 'uname' command displays the current system's information. We can view system information about our Linux environment with the uname command in Linux. With the uname -a command, we can learn more about our system, including Kernel Name, Node Name, Kernel Release, Kernel Version, Hardware Platform, Processor, and Operating System.

Syntax

1. # uname

```
(kali@ kali)-[~/Desktop]
$ uname
Linux

(kali@ kali)-[~/Desktop]
$ uname -a
Linux kali 6.0.0-kali3-amd64 #1 SMP PREEMPT_DYNAMIC Debian 6.0.7-1kali1 (2022-11-07) x86_64 GNU/Linux

(kali@ kali)-[~/Desktop]
$ users
kali
```

12. uptime Command

The **'uptime'** command displays the amount of time the system has been running. Uptime's basic usage is simple: simply **type** the name of the command and click **Enter.**

Use the **-p** command-line option if we merely want to know how long the system has been up for and in a more human-readable format.

Syntax

1. # uptime

13. users Command

The 'users' command is used to display the **login names** of users logged in on the system.

Syntax

1. # users

```
(kali@ kali)-[~/Desktop]

susers
kali Home
```

14. less Command

In Kali Linux, the 'less' command is used to view files instead of opening the file. The less command is a more powerful variant of the "more" command which is used to show information one page at a time to the terminal.

We can view any text file with the help of the "less" command simply by typing the following command into a terminal window:

Syntax:

1. # less /etc/passwd

```
File Actions Edit View Help
root:x:0:0:root:/root:/usr/bin/zsh
daemon:x:1:1:daemon:/usr/sbin:/usr/sbin/nologin

iodine:x:11<u>1</u>:65534::/run/iodine:/usr/sbin/nologin
 etc/passwd
```

15. more Command

The "more" command permits us to show output in the terminal one page at a time. This is particularly beneficial when using a command that requires a lot of scrolling, such as the 'ls' command or the 'du' commands.

The 'more' command works with any applications that output to the screen. A good way to test this is to type the following command into a terminal window:

Syntax:

1. # moreetc/passwd

```
(kali⊗kali)-[~]
 5 more /etc/passwd
root:x:0:0:root:/root:/usr/bin/zsh
daemon:x:1:1:daemon:/usr/sbin:/usr/sbin/nologin
bin:x:2:2:bin:/bin:/usr/sbin/nologin
sys:x:3:3:sys:/dev:/usr/sbin/nologin
sync:x:4:65534:sync:/bin:/bin/sync
games:x:5:60:games:/usr/games:/usr/sbin/nologin

nobody:x:65534:65534:nobody:/nonexistent:/usr/sbin/nologin
_apt:x:100:65534::/nonexistent:/usr/sbin/nologin
systemd-timesync:x:101:101:systemd Time Synchronization,,,:/run/systemd:/usr/sbin/nologin
systemd-network:x:102:103:systemd Network Management,,,:/run/systemd:/usr/sbin/nologin
systemd-resolve:x:103:104:systemd Resolver,,,:/run/systemd:/usr/sbin/nologin
mysql:x:104:110:MySQL Server,,,:/nonexistent:/bin/false
tss:x:105:111:TPM software stack,,,:/var/lib/tpm:/bin/false
strongswan:x:106:65534::/var/lib/strongswan:/usr/sbin/nologin
ntp:x:107:112::/nonexistent:/usr/sbin/nologin
messagebus:x:108:113::/nonexistent:/usr/sbin/nologin
redsocks:x:109:114::/var/run/redsocks:/usr/sbin/nologin
rwhod:x:110:65534::/var/spool/rwho:/usr/sbin/nologin
```

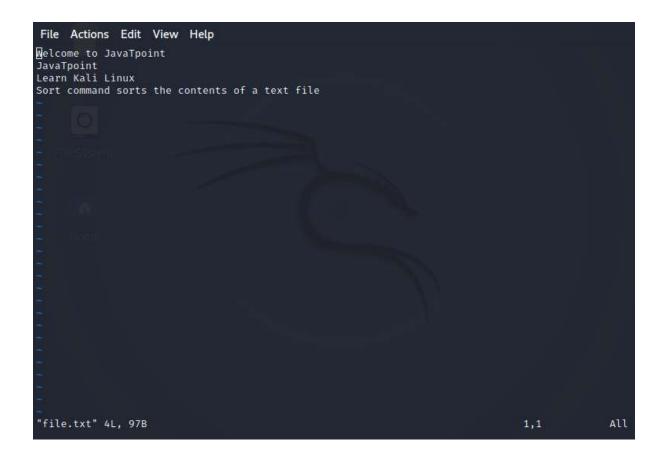

16. vi Command

The 'vi' editor is a screen editor that comes with practically every **UNIX** system. The **command mode** and the **insert mode** are the two most common nodes in vi.

In order to start entering text in an empty file, we have to first switch from the command mode to the insert mode. To accomplish this, start typing the letter i. When we start typing, anything then the type will be entered into the file.

Type some short lines, then press Return at the end of each. **Vi** does not use word wrap like other word processors. It will break a line at the screen' edge. If we make a mistake, we can undo it by pressing the **Backspace** key. If the Backspace key on our computer is not working, then try the **ctrl** + **h** key combination.

17. free Command

In Kali Linux, the 'free' command provides us the useful information about the **amount of RAM** available on a Linux machine. It also displays the entire amount of **physical memory** used and available space, as well as **swap memory** with **kernel buffers.**

Syntax:

1. # free

If we use the **free** command with the **-t** option, it would list the total line at the end.

```
___(kali⊕ kali)-[~/Desktop]

$ free
                total
                              used
                                           free
                                                      shared buff/cache
                                                                             available
Mem:
              2028756
                            996996
                                         347272
                                                       33800
                                                                   684488
                                                                                847696
              1048572
                                        1048572
Swap:
```

18. sort Command

Using the 'sort' command, we can sort the content of the text file, line by line. Sort is a standard command-line program which prints the lines of its input or concentration of all files listed in its argument list in sorted order.

Syntax:

1. # sort file name

We can reverse the order of any file's contents by using the **-r** sort.

Syntax

1. # sort -r

```
(kali® kali)-[~]

$ sort file.text

Java
JavaTpoint
Kali Linux
Kali Linux Operating System
Linux
Welcome to JavaTpoint

(kali® kali)-[~]

$ sort -r file.text
Welcome to JavaTpoint
Linux
Kali Linux Operating System
Kali Linux Operating System
Kali Linux
JavaTpoint
Java
```

19. history Command

The **'history'** command is one of Kali Linux's most commonly used commands. The history command in the bash shell saves a history of commands entered that can be used to repeat commands.

We can run the history command by itself, and it will just print the **current user's bash history** on the screen, as shown below:

Syntax:

1. # history

```
48 ls
49 uname
50 uname -a
51 users
52 uptime
53 users
54 less usr/share/wordlists
55 less usr/share
56 less etc/php
57 vi file.txt
58 free
59 cd Documents
```

20. Pwd Command

In Kali Linux, the 'Pwd' command is used to print working directory. It gives us information about the directory we are now in. This is especially useful if we need to access the directory while in the middle of a complicated process.
